

NaBa-MAR® – Nature-based Managed Aquifer Recharge

Invisible reservoir, visible results

! The problem

- Flash floods, rapid runoff, declining infiltration → water scarcity and flash-flood risk
- Falling groundwater levels
- Damage to groundwater-dependent ecosystems

🔧 How it works

1. Water capture & pre-treatment: rainwater and surface waters
2. Managed infiltration and/or injection: in areas identified by a hydrogeological diagnosis
3. Water recovery & landscape-scale impact

💡 The NaBa-MAR® innovation

- Connecting managed aquifer recharge with flow systems.
- Nature-based, landscape-scale.
- Water flows extend the impact beyond the intervention point.

✨ What makes it special?

- A technological solution built on natural processes
- In harmony with surface-water retention
- Grounded in science
- Cost-effective and nature-friendly

Users & benefits

Environmental – social – economic gains

Municipalities

Improve the water balance of urban green areas

- Cost-efficient irrigation
- Longer-lasting green spaces
- Better quality of life

Rainwater management

- Lower sewer loads
- Reduced flooding
- Groundwater-level rise

Restore wetlands

Restoration of wetlands

- Ecological balance
- Natural carbon sequestration
- Tourism value

Preserve biodiversity

- Conservation targets
- Protection of ecosystem services

Industrial companies

Reduce water footprint

- Improved ESG ratings
- Sustainability goals met
- Stronger reputation

Projects aligned with CSR/ESG reporting

- Credible green image
- Sustainability advantages
- Competitive edge with customers

Agricultural stakeholders

Replenishment of groundwater used for irrigation

- Stable water supply
- Lower drought risk
- Sustainable agriculture

Stabilize groundwater levels

- Higher yields
- Healthier soils
- Less irrigation

Maturity & collaboration

- Demonstration phase + board model; pilots underway
- Services: diagnosis, modelling, intervention design, monitoring strategy
- Next step: needs assessment → preliminary diagnosis → pilot → scaling
